ASX / MEDIA RELEASE

Commentary on Potash West

Highlights

- **MineLife comments on Potash West drilling programme**
- **Drilling on EL3100 encountered thick sequences of potassium bearing material**

Potash West NL (**ASX: PWN**) (“Potash West” or “the Company”) announced the results of a drilling programme on EL 3100 on its prospective, potassium-rich glauconite holdings in Western Australia’s Perth Basin, on 31 May 2011. The Company is pleased to advise that respected resources commentator, MineLife issued a commentary and opinion on 1 June 2011 in its Daily Resources Bulletin. A copy of the article has been made available on the Company’s website: www.potashwest.com.au

It is important to note that EL 3100 comprises only 23% of Potash West tenure in the Dandaragan Trough where the Company controls more than 2,100 sq km of tenements, just north of Perth (see fig 1).

As with such reports, the article contains views and opinions prepared by the researcher, extrapolated from information on the Company already in the public domain. Such views and forecasts do not represent guidance issued by the Company.

About Potash West

Potash West (ASX:PWN) is an exploration company focused on developing potassium-rich glauconite deposits in West Australia’s Perth Basin. The Company aims to define a substantial resource base and investigate how best to recover potash from the mineral. A successful commercial outcome will allow the Company to become a major contributor to the potash market at a time of heightened demand.

The Company listed on the ASX on 11 May 2011 following a successful and oversubscribed IPO raising \$6m. The Company has a major land holding over one of the world’s largest known glauconite deposits, with exploration licenses and applications covering an area of 2,107km². Previous exploration indicates glauconite sediments are widespread for more than 150km along strike and 15km in width.
